Jira Release Evidence Agent Assessment

AI Engineer

Build a tool-using AI agent that determines whether the requirements for a software release are satisfied by evidence recorded in Jira. Choose your own language, framework, model provider and architecture. AI coding tools, including Claude Code and Codex, are allowed.

The problem

An engineering team is preparing to release an enterprise AI application. Its requirements, implementation updates, verification results, approvals and defects are recorded in Jira. A ticket marked Done does not necessarily establish that its acceptance criteria have been satisfied. Your agent must investigate the records and produce one evidence-backed release-readiness report.

What you receive

The supplied inputs/dataset.json contains 400 fictional tickets and 2,059 comments across several releases. Requirements, verification records, implementation claims, approvals and dependencies are represented as linked records. Not every linked record applies to the target build. The release manifest defines the target release and assessment rules.

Your task

1. Use a dedicated project in your own Jira Cloud site and import the supplied records, preserving source identifiers, relationships and recorded evidence.
2. Build an application that accepts the Jira project, dataset scope and target release. The dataset scope is the Jira label your importer applies to every imported issue: use the dataset_label value from the dataset (tyn-release-assessment-v2), so the agent only considers records from this import, even if the project contains other tickets.
3. Let the agent identify the target requirements and use tools to inspect relevant tickets, comments and linked evidence.
4. Produce one final report explaining each requirement decision, its evidence and any outstanding verification or clarification.

Required decisions

Decision	Meaning
PASS	Applicable evidence establishes that the acceptance criterion is satisfied.
FAIL	Applicable evidence establishes a failure or violation.
INSUFFICIENT_EVIDENCE	Evidence is missing, inapplicable or genuinely inconclusive.

The overall decision is BLOCKED if any mandatory requirement fails; NEEDS_REVIEW if none fails but at least one has insufficient evidence; and READY only if every mandatory requirement passes. Missing proof is different from a demonstrated failure.

Evidence and agent behaviour

During assessment, the agent must gather its evidence from Jira. The supplied JSON is only the import input, not the model's assessment context. Use no external evidence or company systems.

Evidence must apply to the correct release, commit, service, environment and any required prompt version. Ticket status alone is not proof. Do not invent missing results or approve requirements from unrelated evidence. Resolve supported requirements instead of marking everything unknown.

Preserve the scenario actor names, roles and event timestamps in the imported record text. Native Jira authors and timestamps belong to the importer and must not be presented as the original fictional actors.

The model must select evidence-gathering or checking actions through tools. A fixed script that sends the complete dataset JSON to a model does not satisfy this requirement. Keep execution bounded and report tool/model failures honestly.

What to submit

- Working source code and pinned dependencies.
- A repeatable importer and clear setup and execution instructions.
- One actual generated release-readiness report, including requirement identifiers, decisions, explanations and supporting Jira ticket/comment references.
- An investigation trace showing tool calls.
- Measured execution time and model/token usage where available.
- A short explanation of design choices, known limits and how you used AI assistance.

Keep account credentials out of the submission.

How we evaluate

We assess decision correctness and evidence applicability, investigation of relevant linked records, tool use and context management, reproducibility, failure handling and your explanation.

Submission

- Submit by replying to the email that sent you this brief, with a link to a Git repository (public, or private and shared with the reviewer named in that email) or a zip file.
- Questions: reply to the same email. We will answer clarifying questions but will not review work in progress.
